

Tabletop Instructions:

The top cover should have three copper outlets on the underside of the pump, these outlets are attached to plastic tubing, adapter tubes, and 2-Tee connectors creating a distribution manifold.

One Tee has a perpendicular black tube about 3" long, this Tee is the connection to the pump.

Use the 1/2" straight connector that comes with the pump. Insert the long end of the connector into the black tube the short side of the fitting goes into the pump.

The pump should remain attached to the tube when the top is placed onto the base.

Hold the pump cord into the slot at the rear, and set the top onto the base.

The flowers slip onto the copper supports on the top of the fountain. There are 3 different lengths so the flowers overlap each other at different heights.

The center should be the tallest and installed last, placing the left and right flowers first is the easiest method of setting the flowers into place.

The pump has a flow adjustment

Trap Door for filling fountain.
